

MANN-FILTER

Product information

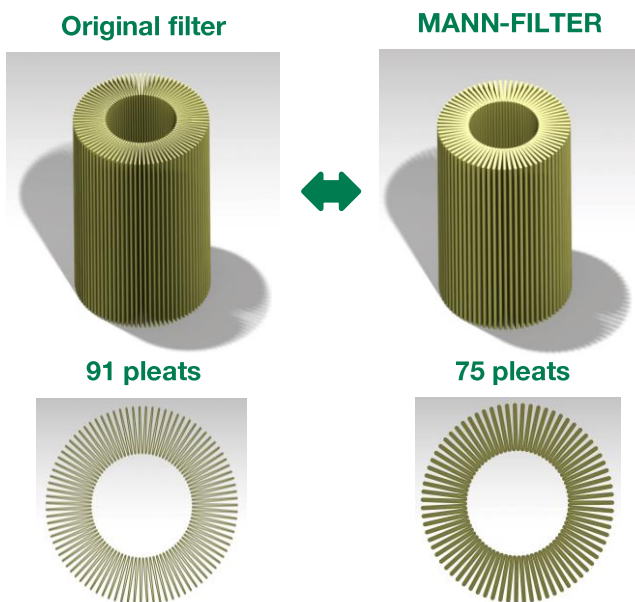

No. 122
03.09.2015

The number of pleats is certainly important, but it's not the only thing that counts!

When comparing two filters from different manufacturers which are to be used for the same purpose, you could be forgiven for thinking, that one of the filters having fewer pleats was cause for alarm.

BUT: the number of pleats in a filter is not the only deciding factor in its performance.

Our filter delivers the same level of performance as the other filter, despite having fewer pleats – that's the MANN-FILTER guarantee.

Example*:

The PU 1059 X consists of 20% fewer pleats than the original part.

BUT: the MANN-FILTER's filtration medium is approximately 20% thicker, which compensates for the reduced filter surface area.

→ That's why with MANN-FILTER, performance is not defined by the number of pleats.

MANN-FILTER MULTIGRADE media ensures optimal filtration performance across the entire filter surface area, with guaranteed protection against damage to the injection system. This allows the same performance levels offered by other products on the market to be achieved with a smaller filter surface area.

What's more, in this example*, the MANN-FILTER boasts a significantly higher total dirt holding capacity than the original. All this guarantees compliance with the same minimum operating performance levels as the original part.

*According to verifiable test results
